

One-dimensional Optical Turbulence

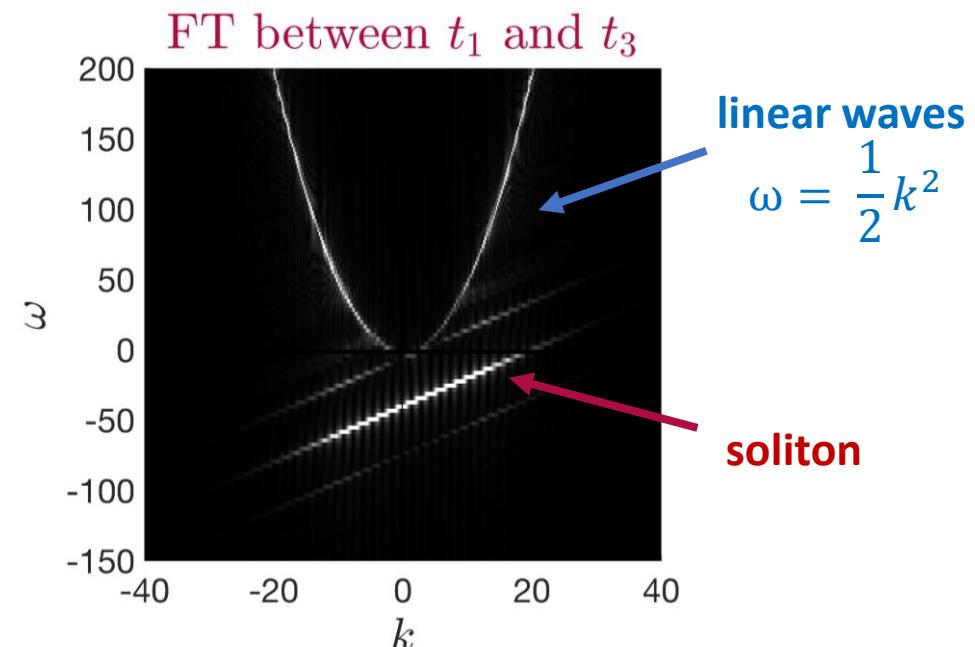

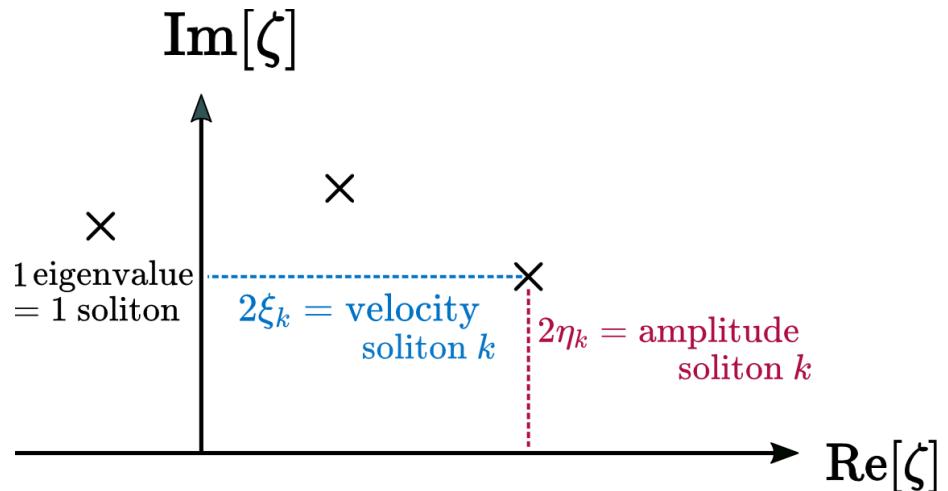

$$i \frac{\partial}{\partial t} u + \frac{1}{2} \frac{\partial^2}{\partial x^2} u + \left(1 - \frac{1}{g} \frac{\partial^2}{\partial x^2} \right)^{-1} |u|^2 = 0$$

modification to 1D pure
non-linear Schrödinger eq.

Non-integrable system
→ turbulent system

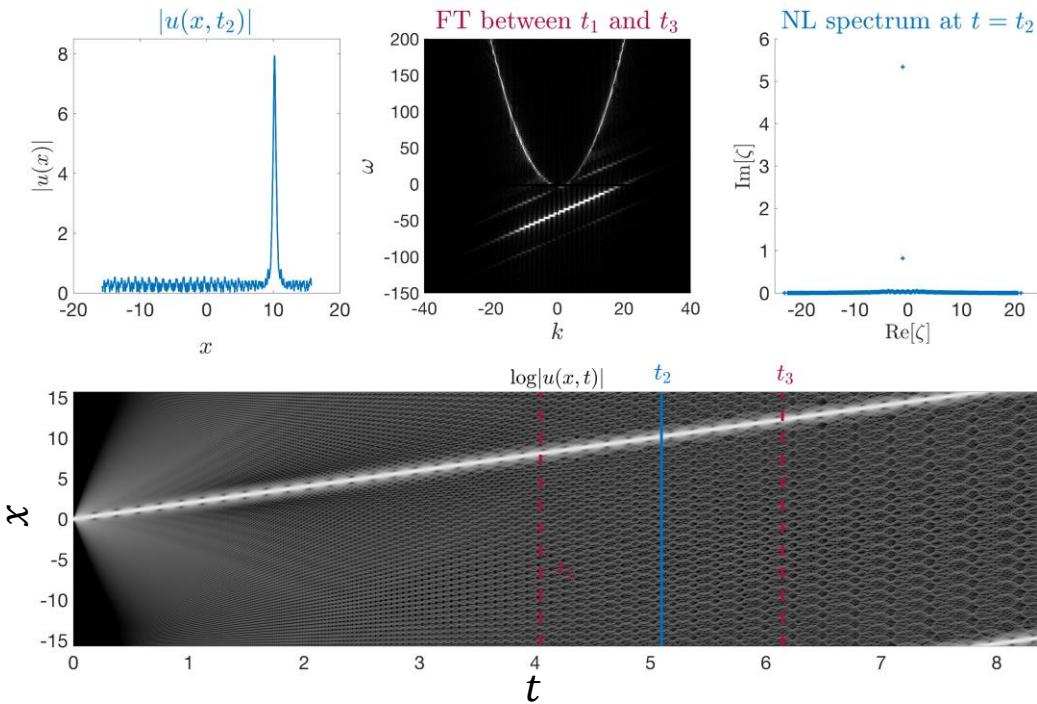

2 ways to characterize the system :

non-linear
spectrum

One-dimensional Optical Turbulence

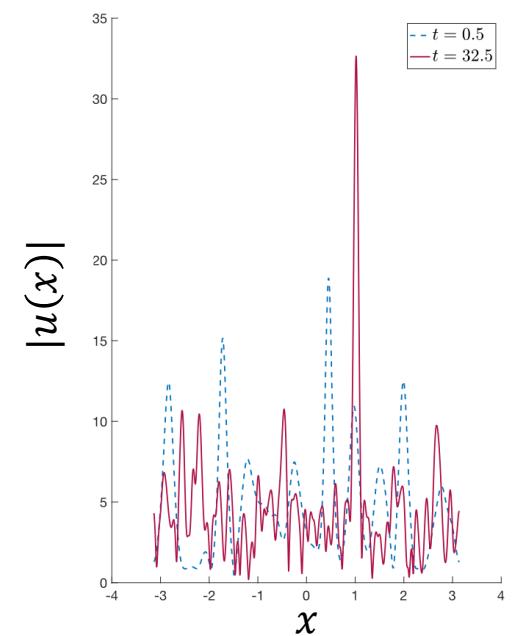

Evolution of a *sech*-profile soliton

- ✓ Creation of waves
- ✓ Appearance of a second soliton

Initial condition

$$u_k = \begin{cases} = A e^{i\varphi_k} & \text{if } 6 \leq k \leq 9 \\ = 0 & \text{else} \end{cases}$$

- ✓ Evolution towards a single big soliton
- ✓ Observed with spectrum
