

Microswimmers exploration under confinement

3D tracking of E. coli

Lateral dispersion

- Interplay bulk of height H / surface with gyration radius R .
- Impact on the lateral spreading ?

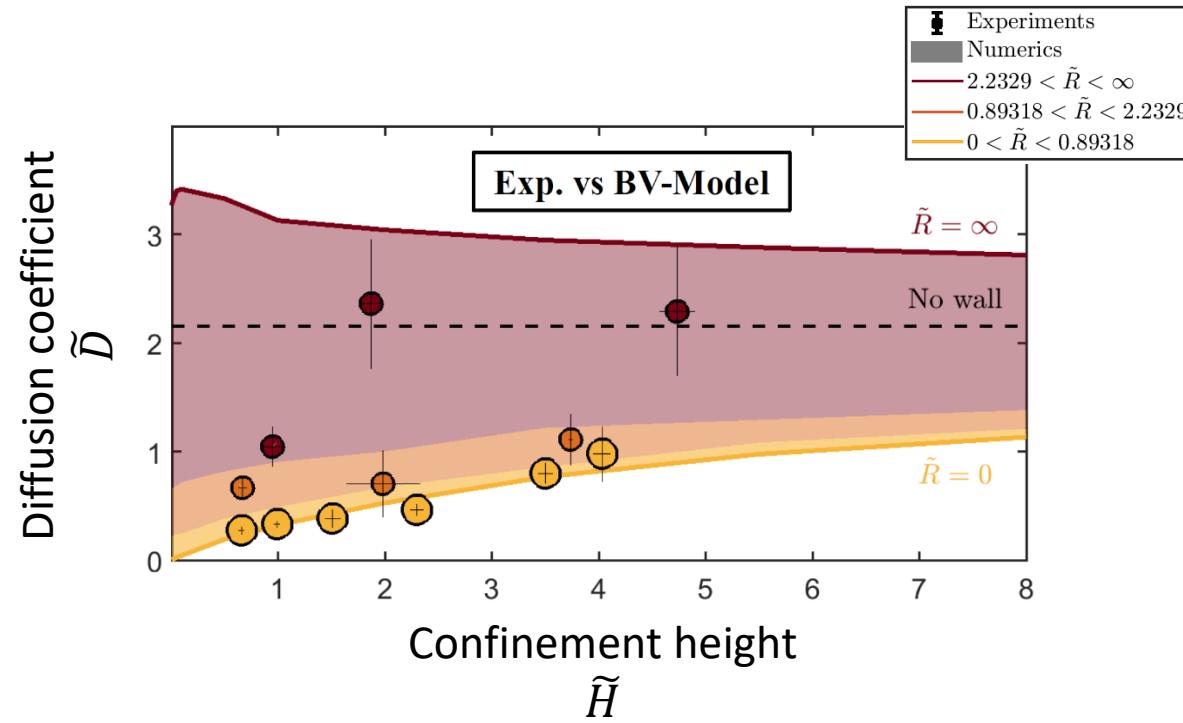

Lateral spreading under confinement

Dimensionless quantities

$$\text{Confinement height } \tilde{H} = H/(V \tau_r)$$

$$\text{Gyration radius } \tilde{R} = R/(V \tau_r)$$

$$\text{Diffusion coefficient } \tilde{D} = D/(0.5 V^2 \tau_r)$$

1. Exploration mainly increases with confinement height \tilde{H} .
2. Exploration increases with gyration radius \tilde{R} .
3. The BV-model predicts quantitatively the experimental outcomes.
